

Stress management - a toolkit

Addressing stress early is crucial. Prolonged stress can lead to serious physical, emotional, and mental health problems, such as anxiety, depression, burnout, and chronic illnesses. By recognising stress early and exploring ways to bring balance—whether through healthy habits, effective time management, relaxation techniques, or seeking social support, we can prevent stress from escalating. Early intervention not only reduces the immediate impact of stress but also builds resilience, helping to manage future challenges more effectively and maintain overall wellbeing.

What can I do?

Stress management requires a holistic approach simply because stress can arise from various aspects of our lives, including physical environments, social interactions, work demands, and personal routines. Here's why making changes in these areas is crucial, as well as some things we might already be engaging with that subconsciously help us manage stress.

Change your immediate situation

The stressful environment

Constant noise or distractions from telephones and an uncomfortable environment can elevate stress levels. Adjusting the physical surroundings (e.g., reducing noise, optimising lighting, creating a calm space) can help to minimize these stress triggers and promote focus and relaxation. An easy way to implement this? - stand outside and just listen to nature, traffic, or the wind in the trees.

Identify your support

Having strong support systems (friends, family, or colleagues) is key to stress resilience. A lack of social support can increase feelings of stressful thought patterns, making it harder to cope with challenges. Strengthening these connections provides emotional outlets, perspective, and encouragement.

Workload

High work pressure, excessive demands, and an overwhelming workload can lead to chronic stress and burnout. It's crucial to manage workload, set realistic goals, and advocate for reasonable expectations at work.

Practice time-blocking to manage work tasks more efficiently. Delegate tasks where possible and avoid multitasking, which often leads to decreased productivity and increased stress.

After work is finished

Habits

Healthy habits are essential for managing stress. Regular exercise, proper hydration, balanced meals, and quality sleep are foundational for stress resilience. Make small, gradual changes, like incorporating a short daily walk or making sure you take time away from your tasks at lunch, this can lead to significant stress reduction over time.

Time

Time management is key to avoiding overwhelming stress. Often, people feel pressured because they have not properly prioritised tasks or allocated time effectively. Balancing time for work, rest, and leisure is essential for overall wellbeing.

Control

Keeping track of your stress levels and seeking feedback from others helps maintain perspective. Regular personal temp-checks can prevent stress from spiralling, while feedback from trusted loved ones can provide clarity on areas of improvement.

Relaxation

Regular relaxation practices like yoga or meditation can calm the nervous system and create mental space to manage stress. Reading can serve as a mental escape, helping to alleviate stress by shifting focus to something enjoyable or insightful.

Exercise

Physical activity, especially in nature (green spaces like parks or blue spaces near water), can reduce stress levels and improve mood. Walking outdoors provides both physical movement and exposure to calming natural environments.

Distraction

Grounding exercises and Progressive Muscle Relaxation techniques are effective for reducing immediate stress by focusing the mind on the body and the present moment, helping to release tension and calm the nervous system. Consider mindfulness apps that guide grounding exercises or relaxation techniques throughout the day or visit YouTube.

Creative

Activities like painting, writing, or playing music allow for emotional expression, helping to reduce stress by focusing on mindful activities. Watching a funny video or spending time with light-hearted friends can provide emotional relief and perspective during stressful times or spending time with animals can reduce cortisol levels and provide emotional comfort, helping to manage stress.
